

Write Go Code To Solve These Problems :

1- Create a Greeting Function

Write a function named `CreateGreeting` that returns another function.

2-The Math Executor

Objective: Create a function that takes two integers and a "math operation" function, and returns the result. **Requirements:**

1. Define a type `MathOp func(a, b int) int`.
2. Create a function `Execute(a, b int, op MathOp) int`.
3. Create three anonymous functions (or standard functions) for Add, Subtract, and Multiply.
4. Pass them into `Execute` and print the results.

3- Write a function named `Filter` that takes a slice of integers and a condition function (`func(int) bool`). It should return a new slice containing only the elements that satisfy the condition.

4- Write a higher-order function named `SortNumbers` that takes a slice of integers and a custom comparator function (`func(a, b int) bool`), and returns a newly sorted slice without modifying the original input.

5-Sentence Builder (String to String):Combine a slice of words into a single sentence separated by spaces.

Input: `[]string{"Go", "is", "an", "awesome", "language"}`

Expected Output: "Go is an awesome language"

Good Luck :)
